Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Reference number: 470677
A.Accession: 470701
A.Accession: 470701
A.Molecule type: protein
A.Molecule type: protein
A.Residues: 1-50, 12, 52-245 <CHO2>
C.Superfamily: rRNA N-glycosidase; rRNA N-glycosidase homology
C.Keywords: glycoprotein; glycosidase; hydrolase; phosphoprotein; seed
F.4-242/Domain: rRNA N-glycosidase homology <RNG>
F.51,201/Binding site: carbohydrate (Asn) (covalent) #status experimental
F.70,158,161/Active site: Tyr, Glu, Arg #status predicted
F.70,558,Binding site: phosphate (Ser) (covalent) (by casein kinase II) #status predicted

C; Comment: The A chain inhibits protein synthesis; it inactivates the 60s ribosomal subuto the cell of the A chain; B chains are also responsible for cell agglutination (lectic C; Comment: This protein is cytotoxic and very poisonous to animals.
C; Superfamily: ricin; rRNA N-glycosidase homology C; Keywords: duplication; glycosidase homology content is a sinal sequence #status predicted (SIG)

                                                                                                                                    A; Molecule type: protein
A; Residues: 303-325, 'F', 327-330, 'T', 332-361, 'D', 363-373, 'G', 375-403, 'T', 405-551, 'V', 553-
C; Comment: This protein has strong agglutinating activity and weak cytotoxicity compared
C; Superfamily: ricin; rRNA N'glycosidase homology
C; Keywords: duplication; glycoprotein; glycosidase; hydrolase; lectin; RNA binding; seed
F; 12-24/Domain: signal sequence #status predicted <SIG>
F; 25-290/Product: agglutinin chain A #status predicted <ACH>
F; 35-281/Domain: RRNA N'glycosidase homology <RNG</br>
F; 303-564/Product: agglutinin chain B #status experimental <BCH>
F; 303-564/Product: agglutinin chain B #status experimental seque repeats
F; 313-261/Ac2-402,405-4043,405-485,450-485,489-528,531-564/Region: 40-residue repeats
F; 314,259/Binding site: carbohydrate (Asn) (covalent) #status predicted
F; 104,147,231,232/Binding site: substrate (Tyr, Tyr, Glu, Asn) #status predicted
F; 202-306,322-341,365-382,453-466,492-509/Disulfide bonds: #status predicted
F; 334,337,348/Binding site: Carbohydrate (Asn) (covalent) #status experimental
F; 356,557/Binding site: N-acetylgalactosamine (Asp, Asn) #status predicted
F; 356,557/Binding site: N-acetylgalactosamine (Asp, Asn) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A,Cross-references: UNIPROT:Q06077; GB:M98345; NID:g166296; PIDN:AAA32625.1; PID:g166297 R;Kimura, M.; Sumizawa, T.; Funatsu, G. A; Molecule type: protein
A; Molecule type: protein
A; Molecule type: protein
A; Residues: 1-261 < KUN>
A; Cross-references: UNIPROT: P23339
A; Cross-references: UNIPROT: P23339
A; Experimental source: seed
C; Comment: This protein prevents the replication of a number of plant viruses, and inhib C; Superfamily: rRNA N-glycosidase, rRNA N-glycosidase homology
C; Keywords: disulfide bond; glycoprotein
F; 6-254/Domain: rRNA N-glycosidase homology < RNG>
F; 6-254/Domain: rRNA N-glycosidase homology < RNG>
F; 6-10,44,255/Blinding site: carbohydrate (Asn) (covalent) #status experimental
F; 34-258,84-105/Disulfide bonds: #status experimental
                                                                                                                                                                                                                              antiviral protein - Virginian pokeweed
Cispecies: Phytolacca americana (Virginian pokeweed)
Cispecies: Phytolacca americana (Virginian pokeweed)

-- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-- SIMILARITY: Belongs to the ribosome-inactivating protein family.

Submitted (SEP-2000) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.

C. I. CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

C. I. CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

C. I. STMILARITY: Belongs to the ribosome-inactivating protein family. BRBL; AV03802; AAR8459.1; -..

Van Damme E.J.M.;

Submitted (AUG-2001) to the EMBL/GenBank/DDBJ databases.

Submitted (AUG-2001) to the EMBL/GenBank/DDBJ databases.

1. CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 288 rRNA.

1. SIMILARITY: Belongs to the ribosome-inactivating protein family.

Ribosome inactivating protein precursor.
Sambucus nigra (Buropean elder).
Elwaryora, Viridiplantae, Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; asterids; campanulids; Dipsacales; Adoxaceae; Sambucus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Feundals W.J.;
Feundals W.J.;
"The major elderberry (Sambucus nigra) fruit protein is a lectin
derived from a truncated type 2 ribosome-inactivating protein.";
Plant J. 12:1251-1260(1997).
-I CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-I SIMILARITY: Belongs to the ribosome-inactivating protein family.
                                                                                                                                                             1 GLD--TVSFSTKGATYITYVNFLNELRVKLKPEG--NSHGIPLLRKKCDDPGKC-FVLVA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       83
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ortigao M., Better M.;
"Momordin II, a ribosome inactivating protein from Momordica
balsamina, is homologome to other plant proteins.";
Nucleic Acids Res. 20:4662-4662(1992).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
-!- Type I RIP subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | : | | | | | | : | | | : | | | : | | | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ETTDLGIEPLRIGIKKLDENAIDNYKPTEIASSLLVVIQMVSEAARFTFIENQIRNNFQQ

            protein.
CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S IRNA.
FTM: Bound to a branched hexasaccharide.
MISCELLANDOUS: Manganese or zinc required for enhancing substrate binding rather than catalysis.
MISCELLANEOUS: The oligosaccharide does not influence the fold of the polypeptide chain and probably does not play a role in the enzymatic function.
MISCELLANDOUS: Is not toxic to uninfected normal cells as it cannot enter into them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PROSITE; PS00275; SHIGA RICIN; 1.

- which Polynucleotide(8) encoding type I ribosome-inactivating proteins - are suitable for use as components of cytotoxic therapeutic agents.

Example 1; Fig 1; 221pp; English.

AAQ75532 encodes AAR65903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R65911. RIPs are key components of cytcoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

tumour and antiviral activity. Also described is a composition
comprising the isolated peptide or polypeptide, and a carrier, excipient
or auxiliary agent. Specifically claimed are MAP30 or GAP31 peptides
or polypeptides. The peptide or polypeptide is useful for treating HIV
infection, and tumour. This is the amino acid sequence of Gelonium anti-
HIV protein 30kDa (MAP30).

The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example gelonin toxin derived from Gelonium multiflorum, that are truncated

c and/or possess reduced antigenicity. Such designer toxins have
therapeutic, diagnostic, and preventative benefits, particularly as
immunotoxins. The method of the invention is useful for generating
proteinaceous compounds with less antigenicity. The immunotoxin and
gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain.
Stin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic,
bone, bone marrow, head and neck, cervical, oesophagus, eye, gall
bladder, kidney, adrenal glands, heart, colon, or blood cancer. The
compositions of the invention are also useful for treating microbial
pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune
diseases, hyperproliferative disorders including cancer, leukaemias,
carthritis, inflammatory diseases, cardiovascular diseases pathogenic
diseases, and diabetes. The method provides less antigenic proteins,
peptides and polypeptides, which are more effective than prior art. The
present sequence represents G. multiflorum recombinant gelonin (rGel)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example gelonin toxin derived from Gelonium multiflorum, that are truncated and/or possess reduced antigenicity. Such designar toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, skin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bund, bone marrow, head and neck, cervical, oseophagus, eye, gall bladder, kidhey, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune arthaltis, inflammatory diseases, cardiovascular diseases, pathogenic diseases, and diabetes. The method provides less antigenic proteins, microbial and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

A new recombinant DNA vector construct has been developed which encodes a fusion protein and is suitable for introduction into a bacterial host. The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (a) Encayage site located between (d) and (b). The present sequence represents the protein from the pING3797 vector construct which codes for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endocaxins and hegarin, neutralising their effects. The peptides have further been shown to inhibit angiogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without significant proteolysis, and in some cases are actually secreted from the host cells. This allows the indirect production of anti-microbial BPI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bactericidal/permeability increasing peptide; BPI; fusion protein; bacterial infection; fungal infection; endotoxin; heparin; anglogenesis; fungicidal; recombinant DNA; vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant production of bactericidal/permeability increasing protein - by expression as a fusion protein in microbial host cells, then cleaving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GLDTVSFSTKGATYITYVNFLNELRVKLKPEGNSHGIPLLRKKCDDPGKCFVLVALSNDN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The vector comprises: (a) DNA encoding at least one cationic bacterial host.

The vector comprises: (a) DNA encoding at least one cationic cartical/permeability increasing peptide (BPI), (b) DNA encoding at least one cationic cartier protein, and (c) DNA encoding an amino acid (aa) cleavage site located between (a) and (b). The present sequence represents the protein from the pING3793 vector construct which codes for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to inhibit angiogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without significant proteolysis, and in some cases are actually secreted from the peptides in microbial hosts
                                                                                                                                                                                                                              262

```
AAR63912-R63924 are analogs of AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. The are key components of cytocoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                               - which
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotide(s) encoding type I ribosome-inactivating proteins - are suitable for use as components of cytotoxic therapeutic agents.

RIPB are key components of cytocoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to eslectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. The are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

AAR63912-R63924 are analogs of AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune

RIPs are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to

RIPs are key components of cytotoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the

RIPs are key components of cycotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of
                                                                     9
